

MISO

One-page app summary based on repo evidence

What It Is

- MISO is a Laravel 12 + Vue 3 web app that brings workplace communication and day-to-day operations into one authenticated interface.
- Repo evidence shows modules for boards, posts, projects, schedules, files, contacts, learning, assets, reminders, dashboards, and AI-assisted document workflows.

Who It Is For

- Primary persona: authenticated company staff, team leads, and admins coordinating communication, tasks, projects, records, and shared files in one place.
- Exact industry or tenant context: Not found in repo.

How To Run

1. Install dependencies: `composer install` and `npm install`
2. Create env file and app key: copy `.env.example` to `.env`, then `php artisan key:generate`
3. Set database values in `.env`
4. Run schema setup: `php artisan migrate`
5. Build or start frontend: `npm run dev`
6. Start the app server: `php artisan serve`

What It Does

- Team boards with messaging, reactions, reminders, attachments, unread state, and badges.
- Post-style spaces for knowledge, challenge, and recognition flows.
- Project workspaces with members, plans, finance, goals, cases, contracts, and reports.
- Calendar, schedule, timesheet, and reminder workflows for daily operations.
- Shared drive, file preview, downloads, ACLs, and access logging.
- Contact management, community/member views, learning, support, and dashboards.
- AI endpoints for prompt streaming, review flows, and text-to-speech.

How It Works

- UI: Blade layout loads Vite bundles and mounts a Vue SPA into `#app`; Vue Router and Pinia organize feature modules.
- Client flow: axios sends authenticated requests to Laravel web routes; Vuetify and shared stores power the interactive interface.
- Backend: large route map points to domain controllers such as `BoardController`, `ProjectController`, `TaskController`, `DriveController`, `ContactController`, and `DashboardController`.
- Domain layer: Eloquent models and app services handle badges, reminders, notifications, file logging, project formulas, reports, and contact scanning.
- Data and integrations: MySQL is the default database; files use Laravel local/public disks; repo config also references Redis, Pusher, Google OAuth, Socket.IO, and OpenAI.
- Real time: frontend bootstrap emits socket events from API responses and opens a socket.io connection via `broadcaster.ts`.
- Exact production deployment topology: Not found in repo.

Repo Evidence

Evidence used: `README.md`, `composer.json`, `package.json`, `routes/web.php`, `resources/js/app.js`, `resources/js/router.js`, `resources/views/layouts/app.blade.php`, `resources/views/board.blade.php`, `app/Http/Controllers/*`, `app/Services/*`, `app/Models/*`, `config/*`, `php`, `.env.example`.
